

Laporan Mini Project

Deny Lukman Syarif

Latar Belakang :

Jaringan komputer adalah jaringan yang memungkinkan antar komputer untuk saling berkomunikasi dengan bertukar data satu sama lain. Untuk memungkinkan komunikasi antar komputer ini bisa terjadi, perlu dilakukan konfigurasi pada hardware dan software. Mulai dari konfigurasi kabel, ip addressing, vlan, subnetting, dll. Konfigurasi ini bisa dilakukan secara manual satu per satu pada setiap *device*. Namun sekarang kita sudah memasuki era *automation* atau sering disebut *Network Programmability*. Sekarang kita dapat mengkonfigurasi *device* hanya dengan beberapa tahap, bahkan bisa hanya dengan menjalankan satu *script* yang kita buat untuk mengkonfigurasi semua *device*.

Cisco developer memberikan fasilitas kepada kita untuk belajar mengenai jaringan komputer. Salah satu layanan yang ada pada cisco developer adalah **sandbox**. Sandbox menyediakan banyak fasilitas di dalamnya dari networking, data center, cloud, security, IoT, dll. Yang dapat kita gunakan secara gratis dengan cara melakukan reservasi. Pada sanbox ini menerapkan konsep *hands on lab*, kita dapat menggunakannya untuk belajar seperti mengkonfigurasi router, switch, membangun simulasi small network, dll.

Cisco Modelling Labs (CML) adalah salah satu layanan yang terdapat pada sandox. CML ini mirip dengan packet tracer namun lebih powerfull. CML pada sandbox terdapat 2 jenis, CML dan CML enterprise. Perbedaannya adalah durasi reservasi yang diberikan, untuk CML hanya 4 jam maksimal, sedangkan CML enterprise maksimal 2 hari. Sandbox menggunakan koneksi vpn untuk akses *client*-nya. Di dalam CML ini kita dapat mendesain, simulasi, testing network, dll. Namun pada CML ini sering terjadi *disconnect*, sehingga tidak dapat menjalankan fitur-fiturnya secara maksimal seperti menjalankan *console*, *info real-time*, dll.

Berdasarkan uraian di atas, saya mencoba membuat program menggunakan python untuk mengatasi masalah tersebut dengan memanfaatkan CML API. Dan mencoba membuat small network pada CML menggunakan script dan mengkonfigurasi perangkatnya dengan RESTCONF untuk router dan NXAPI untuk switch.

Rancangan Umum Project :

- Membuat program interaktif menggunakan python untuk memantau labs pada CML (informasi labs, menjalankan lab, menghentikan lab, membuat lab, menghapus lab, mendownload topology lab, membuat node/menambahkan device, menghapus node/device, update konfigurasi perangkat/node, menghidupkan interface device, membuat link antar device)
- Membuat script automation untuk membangun topology small network
- Mengkonfigurasi router csr1000v dengan RESTCONF
- Mengkonfigurasi switch nxosv9000 dengan NXAPI
- Mengakses perangkat pada CML lewat terminal local dengan breakout tools pada CML (melalui telnet localhost port)
- Menggunakan ansible untuk backup running-configuration router dan switch pada small network tersebut

Penjelasan Project :

A. Membuat Program Interaktif CML

1. Membuat utilities module (utilities.py)

Module ini digunakan untuk utilities clear output dan generate url api.

```
from os import system, name
```

```

from config import *
import pprint
pp = pprint.PrettyPrinter(indent=4, sort_dicts=False)

def clear():
    if name == "posix":
        system("clear")
    else:
        system("cls")

def url(endpoint: str):
    URL = BASE_URL + endpoint
    return URL

```

2. Membuat Config Module (config.py)

Module ini digunakan untuk inisialisasi variable seperti host ip CML, token JWT, base url API CML.

```

import requests as req
import json
req.packages.urllib3.disable_warnings()

headers = {
    'Accept': "application/json",
    'Content-Type': "application/json"
}

url = "https://10.10.20.161/api/v0/authenticate"
data = json.dumps({
    'username': 'developer',
    'password': 'C1sco12345'
})
resp_token = req.post(url, headers=headers, data=data, verify=False)

HOST = "https://10.10.20.161"
BASE_URL = "{} /api/v0".format(HOST)
token = resp_token.json()

headers = {
    "Accept": "application/json",
    "Authorization": "Bearer {}".format(token)
}

```

3. Membuat Labs Module (Labs.py)

Module ini digunakan untuk meng-*handle* lab-lab pada CML, terdapat:

- ◆ function showDetailLab(labs): untuk menampilkan informasi lab-lab ke layar dari parameter labs

- ◆ function getLabs(): untuk men-get informasi dari CML menggunakan api /labs
- ◆ function getIdLab(process): untuk mengambil id lab, parameter process ini berupa string untuk generate kalimat sesuai proses yang dipilih, misalnya create, hapus, start.
- ◆ function startLab(): untuk menjalankan lab
- ◆ function stopLab(): untuk menghentikan lab
- ◆ function createLab(): untuk membuat lab
- ◆ function deleteLab(): untuk menghapus lab
- ◆ function getTopologyLab(): digunakan untuk men-get topology lab berdasarkan id lab, nantinya akan disimpan ke dalam format yaml dan json pada directory topology

```

from utilities import *
import json
import yaml
import time

def showDetailLab(labs):
    clear()
    print("="*30)
    print("no |t\tdetails")
    print("="*30)
    for i in range(len(labs)):
        print("{} ".format(str(i+1)), end="")
        pp.pprint(labs[i])

def getLabs():
    # get all id of labs
    URL = url('/labs')
    resp = req.get(URL, headers=headers, verify=False)

    labs = []

    # get detail of each lab from id
    for id_lab in resp.json():
        #URL = "{} /labs/{}".format(BASE_URL, id_lab)
        endpoint = "/labs/" + id_lab
        URL = url(endpoint)
        lab = req.get(URL, headers=headers, verify=False)
        labs.append(lab.json())

    # show the detail lab in screen
    return labs

def getIdLab(process: str):
    labs = getLabs()
    check = False
    lab_no = 0
    while check == False:

```

```
lab_no = input("{} lab no : ".format(process))
if lab_no.isdigit():
    lab_no = int(lab_no)
    if lab_no > 0 and lab_no <= len(labs):
        check = True
    else:
        print("only input lab no that show in screen!")
else:
    print("only input lab no that show in screen!")
```

```
id_labs = labs[lab_no-1]['id']
return id_labs
```

```
def startLab():
    id_labs = getIdLab('start')

    endpoint = "/labs/{}/start".format(id_labs)
    URL = url(endpoint)

    print("Starting Lab with id {} ...".format(id_labs))
    resp = req.put(URL, headers=headers, verify=False)
    print("status: "+ resp.json())
```

```
def stopLab():
    id_labs = getIdLab('stop')

    endpoint = "/labs/{}/stop".format(id_labs)
    URL = url(endpoint)

    print("Stopping Lab with id {} ...".format(id_labs))
    resp = req.put(URL, headers=headers, verify=False)
    print("status: "+ resp.json())
```

```
def createLab():
    title = input("lab title : ")

    endpoint = "/labs?title={}".format(title)
    URL = url(endpoint)
    print("Creating Lab with title '{}' ...".format(title))
    resp = req.post(URL, headers=headers, verify=False)
    print(resp.text)
```

```
def deleteLab():
    id_labs = getIdLab('delete')

    endpoint = "/labs/{}/wipe".format(id_labs)
```

```

URLwipe = url(endpoint)

print("Deleting Lab id {}".format(id_labs))

endpoint = "/labs/{}".format(id_labs)
URL = url(endpoint)
ask = input("Really want to delete lab {} ? (y/n): ".format(id_labs))
if ask == 'y' or ask == '':
    req.put(URLwipe, headers=headers, verify=False)
    resp = req.delete(URL, headers=headers, verify=False)
    print(resp)
else:
    print("cancelling...")
    time.sleep(1)
    return

def getTopologyLab():
    id_labs = getIdLab('get topology')

    endpoint = "/labs/{}/topology".format(id_labs)
    URL = url(endpoint)

    print("Processing get topology {}".format(id_labs))

    headers['Accept'] = 'text/plain'
    resp = req.get(URL, headers=headers, verify=False)
    ask = input('do u want to save the topology to the file? (y/n): ')
    if ask == 'y' or ask == '':
        location = './topology/lab_{}.json'.format(id_labs)
        f = open(location, 'w')
        f.write(resp.text)
        f.close()

        with open(location, 'r') as jsonfile:
            jsonread = json.load(jsonfile)

        location2 = './topology/lab_{}.yaml'.format(id_labs)
        f = open(location2, 'w')
        f.write(yaml.dump(jsonread))
        f.close()

        print("Success save topology in {} and {}".format(location, location2))
        time.sleep(2)
    elif ask == 'n':
        pp.pprint(resp.json())

```

4. Membuat Nodes Module (Nodes.py)

Module ini digunakan untuk meng-*handle* node-node pada lab, terdapat:

- ◆ function createNode(): untuk membuat node/menambahkan perangkat pada lab
- ◆ function updateConfigNodes(): untuk mengupdate konfigurasi perangkat melalui path file config yang diinputkan
- ◆ function deleteNode(): untuk menghapus node/perangkat pada lab

```
from config import *
from utilities import *
from Labs import getIdLab
import json

def createNode():
    id_labs = getIdLab('create node in')
    print("id lab: {}".format(id_labs))
    endpoint = "/labs/{}/nodes".format(id_labs)
    URL = url(endpoint)
    x = input("x: ")
    y = input("y: ")
    label = input('label: ')
    configuration = input('configuration: ')
    node_definition = input("node_definition: ")
    image_definition = input("image_definition: ")

    data = json.dumps({
        "x": int(x),
        "y": int(y),
        "label": label,
        "configuration": configuration,
        "node_definition": node_definition,
        "image_definition": image_definition,
        "ram": None,
        "cpus": None,
        "cpu_limit": None,
        "data_volume": None,
        "boot_disk_size": None,
        "tags": [
            ""
        ]
    })

    print("Creating node in lab with id {}...".format(id_labs))
    resp = req.post(URL, headers=headers, data=data, verify=False)
    print(resp.text)

def updateConfigNodes():
    id_labs = getIdLab('update configuration node in')
    print("id lab: {}".format(id_labs))
    node = input("node: ")
```

```

config = input("config path file: ")

f = open(config, 'r')
payload = f.read()
f.close()

endpoint = "/labs/{}/nodes/{}/wipe_disks".format(id_labs, node)
URL = url(endpoint)
req.put(URL, headers=headers, verify=False)

endpoint = "/labs/{}/nodes/{}/config".format(id_labs, node)
URL = url(endpoint)

headers['Content-Type'] = "text/plain"
resp = req.put(URL, headers=headers, data=payload, verify=False)
print(resp.text)

def deleteNode():
    id_labs = getIdLab('delete node in')
    print("id lab: {}".format(id_labs))
    node = input("node: ")

    endpoint = "/labs/{}/nodes/{}/wipe_disks".format(id_labs, node)
    URL = url(endpoint)
    req.put(URL, headers=headers, verify=False)

    endpoint = "/labs/{}/nodes/{}".format(id_labs, node)
    URL = url(endpoint)

    resp = req.delete(URL, headers=headers, verify=False)
    print(resp.text)

```

5. Membuat Interfaces Module (Interface.py)

Module ini digunakan untuk membuat/mengaktifkan interface/port pada node. User akan diminta untuk menginputkan node yang mana dan pada slot berapa.

```

from config import *
from utilities import *
from Labs import getIdLab
import json

def createInterfaces():
    id_labs = getIdLab('create interface on node in')
    print("id lab: {}".format(id_labs))
    node = input("node: ")
    slot = input("slot: ")

    endpoint = "/labs/{}/nodes/{}/wipe_disks".format(id_labs, node)

```

```

URL = url(endpoint)
req.put(URL, headers=headers, verify=False)

endpoint = "/labs/{}/interfaces".format(id_labs)
URL = url(endpoint)

data = json.dumps({
    'node': node,
    'slot': int(slot)
})

print("Creating interface on node {} in lab with id {}".format(node, id_labs))
resp = req.post(URL, headers=headers, data=data, verify=False)
print(resp.text)

```

6. Membuat Links Module (Links.py)

Module ini digunakan untuk membuat link antar node, dengan menginputkan source interface id dan destination interface id

```

from config import *
from utilities import *
from Labs import getIdLab
import json

def createLinks():
    id_labs = getIdLab('create link in')
    print("id lab: {}".format(id_labs))
    endpoint = "/labs/{}/links".format(id_labs)
    URL = url(endpoint)
    src_int = input("src_int: ")
    dst_int = input("dst_int: ")

    data = json.dumps({
        'src_int': src_int,
        'dst_int': dst_int
    })

    print("Creating links in lab with id {}".format(id_labs))
    resp = req.post(URL, headers=headers, data=data, verify=False)
    print(resp.text)

```

7. Membuat Main Program (manage_cml.py)

Program ini digunakan untuk menyatukan module-module di atas agar dapat dijalankan secara interaktif dan realtime oleh user

```

import time
import json
from utilities import *

```

```

import Labs
import Nodes
import Interfaces
import Links

def main():
    intro = """
    =====
    Menu:
    =====
    0. exit
    1. start lab
    2. stop lab
    3. create lab
    4. delete lab
    5. get topology lab

    6. create node
    7. delete node
    8. update config node

    9. create interfaces

    10. create links
    =====
    """
    print(intro, end="")
    cek = False
    while(cek == False):
        choose = input("choose (1-9) / 0 for exit: ")
        if choose == '0':
            cek = True
            print("Goodbye!!!")
            exit()
        if choose == '1':
            Labs.startLab()
            cek = True
        elif choose == '2':
            Labs.stopLab()
            cek = True
        elif choose == '3':
            Labs.createLab()
            cek = True
        elif choose == '4':

```

```
Labs.deleteLab()
cek = True
elif choose == '5':
    Labs.getTopologyLab()
    cek = True
elif choose == '6':
    Nodes.createNode()
    cek = True
elif choose == '7':
    Nodes.deleteNode()
    cek = True
elif choose == '8':
    Nodes.updateConfigNodes()
    cek = True
elif choose == '9':
    Interfaces.createInterfaces()
    cek = True
elif choose == '10':
    Links.createLinks()
    cek = True
elif choose == 'refresh':
    return

time.sleep(5)
clear()
while True:
    print("Getting Labs...")
    labs = Labs.getLabs()
    Labs.showDetailLab(labs)
main()
```

B. Membuat Automation Build Small Network pada CML

1. Membuat Design Small Network

bridge = n0

unmanaged switch = n1

R1 = n2

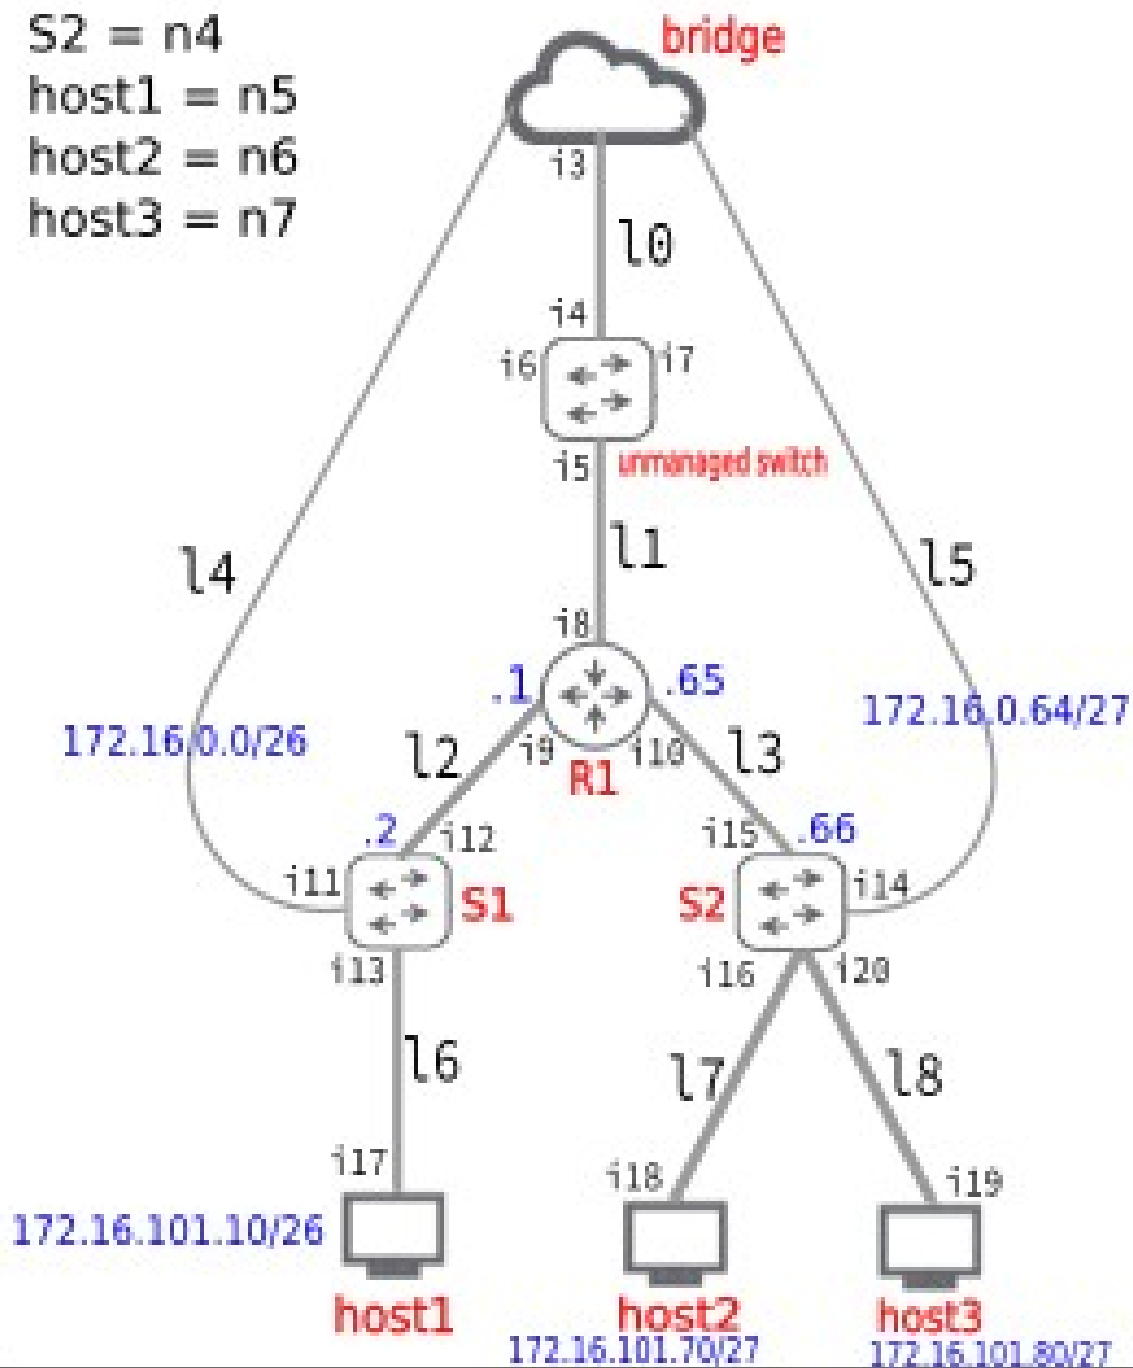

S1 = n3

S2 = n4

host1 = n5

host2 = n6

host3 = n7

2. Membuat Automation Module (automation.py)

Module ini digunakan untuk automation build network pada CML. Function-function nya menggunakan function dari modul sebelumnya (function createLab(), createNode(), updateConfigNodes(), createInterface(), dan createLinks()) dengan memodifikasi beberapa bagian dan parameter, karena sebelumnya untuk program interaktif.

```
from config import *
from utilities import *
import json
import yaml
import time

# LABS
def createLab(getTitle: str):
    title = getTitle

    endpoint = "/labs?title={}".format(title)
    URL = url(endpoint)
    print("Creating Lab with title '{}' ...".format(title))
    resp = req.post(URL, headers=headers, verify=False)
    idlab = resp.json()
    return idlab['id']

# NODES
def createNode(getId, data):
    id_labs = getId
    print("id lab: {}".format(id_labs))
    endpoint = "/labs/{}/nodes".format(id_labs)
    URL = url(endpoint)

    payload = json.dumps({
        "x": data['x'],
        "y": data['y'],
        "label": data['label'],
        "configuration": data['configuration'],
        "node_definition": data['node_definition'],
        "image_definition": data['image_definition'],
        "ram": None,
        "cpus": None,
        "cpu_limit": None,
        "data_volume": None,
        "boot_disk_size": None,
        "tags": [
            ""
        ]
    })

    print("Creating node in lab with id {}...".format(id_labs))
```

```

resp = req.post(URL, headers=headers, data=payload, verify=False)
return resp.text

def updateConfigNodes(getId, getNode, fileConfig):
    id_labs = getId
    print("id lab: {}".format(id_labs))
    node = getNode
    config = fileConfig

    f = open(config, 'r')
    payload = f.read()
    f.close()

    endpoint = "/labs/{}/nodes/{}/wipe_disks".format(id_labs, node)
    URL = url(endpoint)
    req.put(URL, headers=headers, verify=False)

    endpoint = "/labs/{}/nodes/{}/config".format(id_labs, node)
    URL = url(endpoint)

    headers['Content-Type'] = "text/plain"
    resp = req.put(URL, headers=headers, data=payload, verify=False)
    return resp.text

# INTERFACES
def createInterfaces(getId, data):
    id_labs = getId
    print("id lab: {}".format(id_labs))

    endpoint = "/labs/{}/nodes/{}/wipe_disks".format(id_labs, data['node'])
    URL = url(endpoint)
    req.put(URL, headers=headers, verify=False)

    endpoint = "/labs/{}/interfaces".format(id_labs)
    URL = url(endpoint)

    payload = json.dumps({
        'node': data['node'],
        'slot': data['slot']
    })

    print("Creating interface on node {} in lab with id {}".format(data['node'], id_labs))
    resp = req.post(URL, headers=headers, data=payload, verify=False)
    return resp.text

```

```
# LINKS
def createLinks(getId, data):
    id_labs = getId
    print("id lab: {}".format(id_labs))
    endpoint = "/labs/{}/links".format(id_labs)
    URL = url(endpoint)

    payload = json.dumps({
        'src_int': data['src_int'],
        'dst_int': data['dst_int']
    })

    print("Creating links in lab with id {}".format(id_labs))
    resp = req.post(URL, headers=headers, data=payload, verify=False)
    return resp.text
```

3. Membuat Script Automation Build Lab (script-automation-lab.py)

membuat script automation dari design network pada step 1. Pada script ini meng-import module automation yang dibuat pada step 2.

```
from automation import *

id_lab = createLab('project_lab')

nodes = [
    {
        'x': 0,
        'y': 0,
        'label': 'bridge',
        'configuration': "./script-config/config-external-connector.txt",
        'node_definition': 'external_connector',
        'image_definition': 'null'
    },
    {
        'x': 0,
        'y': 200,
        'label': 'unmanaged switch',
        'configuration': "",
        'node_definition': 'unmanaged_switch',
        'image_definition': 'null'
    },
    {
        'x': 0,
        'y': 400,
        'label': 'R1',
        'configuration': "",
        'node_definition': 'csr1000v',
        'image_definition': 'csr1000vb'
    },
]
```

```

{
    'x': -400,
    'y': 700,
    'label': 'S1',
    'configuration': '',
    'node_definition': 'nxosv9000',
    'image_definition': 'nxosv9000'
},
{
    'x': 400,
    'y': 700,
    'label': 'S2',
    'configuration': '',
    'node_definition': 'nxosv9000',
    'image_definition': 'nxosv9000'
},
{
    'x': -400,
    'y': 900,
    'label': 'host1',
    'configuration': './script-config/config-host1.txt',
    'node_definition': 'desktop',
    'image_definition': 'desktop-3-13-2-xfce'
},
{
    'x': 200,
    'y': 900,
    'label': 'host2',
    'configuration': './script-config/config-host2.txt',
    'node_definition': 'desktop',
    'image_definition': 'desktop-3-13-2-xfce'
},
{
    'x': 600,
    'y': 900,
    'label': 'host3',
    'configuration': './script-config/config-host3.txt',
    'node_definition': 'desktop',
    'image_definition': 'desktop-3-13-2-xfce'
}
]

```

```

for node in nodes:
    print(createNode(id_lab, node))

```

```

mynode = {
    'bridge': 'n0',
    'uswitch': 'n1',
    'router': 'n2',
    's1': 'n3',
    's2': 'n4',
    'host1': 'n5',
    'host2': 'n6',
    'host3': 'n7'
}

# update config host setting ip
for node in nodes:
    if node['label'] == 'bridge' or node['label'] == 'host1' or node['label'] == 'host2' or node['label'] == 'host3':
        n = node['label']
        print(updateConfigNodes(id_lab, mynode[n], node['configuration']))

interfaces = [
    {
        'node': mynode['bridge'],
        'slot': 0
    },
    {
        'node': mynode['uswitch'],
        'slot': 0
    },
    {
        'node': mynode['uswitch'],
        'slot': 1
    },
    {
        'node': mynode['uswitch'],
        'slot': 2
    },
    {
        'node': mynode['uswitch'],
        'slot': 3
    },
    {
        'node': mynode['router'],
        'slot': 0
    },
    {
        'node': mynode['router'],
        'slot': 1
    },
    {

```

```
    'node': mynode['router'],
    'slot': 2
},
{
    'node': mynode['s1'],
    'slot': 0
},
{
    'node': mynode['s1'],
    'slot': 1
},
{
    'node': mynode['s1'],
    'slot': 2
},
{
    'node': mynode['s2'],
    'slot': 0
},
{
    'node': mynode['s2'],
    'slot': 1
},
{
    'node': mynode['s2'],
    'slot': 2
},
{
    'node': mynode['host1'],
    'slot': 0
},
{
    'node': mynode['host2'],
    'slot': 0
},
{
    'node': mynode['host3'],
    'slot': 0
},
{
    'node': mynode['s2'],
    'slot': 3
},
]
```

```
for interface in interfaces:
    print(createInterfaces(id_lab, interface))
```

```

links = [
    {
        'src_int': 'i3',
        'dst_int': 'i4'
    },
    {
        'src_int': 'i5',
        'dst_int': 'i8'
    },
    {
        'src_int': 'i9',
        'dst_int': 'i12'
    },
    {
        'src_int': 'i10',
        'dst_int': 'i15'
    },
    {
        'src_int': 'i11',
        'dst_int': 'i6'
    },
    {
        'src_int': 'i14',

        'dst_int': 'i20'
    }
]

for link in links:
    print(createLinks(id_lab, link))

print("Done!!!")

```

untuk konfigurasi node external-connector, host1, host2, dan host3 terdapat scriptnya pada directory script-config:

config-external-connector.txt	host1.txt	host2.txt	host3.txt
--------------------------------------	------------------	------------------	------------------

bridge0	sudo ifconfig eth0 172.16.101.10 netmask 255.255.255.192 hostname host2 USERNAME=host1 PASSWORD=host1	sudo ifconfig eth0 172.16.101.70 netmask 255.255.255.224 hostname host2 USERNAME=host2 PASSWORD=host2	sudo ifconfig eth0 172.16.101.80 netmask 255.255.255.224 hostname host3 USERNAME=host3 PASSWORD=host3
---------	--	--	--

C. Membuat Script RESTCONF (./RESTCONF/config.py)

script ini digunakan untuk mengkonfigurasi router csr1000v (R1) menggunakan fitur restconf. Pada script ini berisi konfigurasi interface GigabitEthernet2 172.16.0.1/26 untuk subnet 1 dan GigabitEthernet3 172.16.0.65/27 untuk subnet 2. Lalu juga save running-config ke startup-config.

```
import requests
import json
requests.packages.urllib3.disable_warnings()

data_ip = ['172.16.0.1','172.16.0.65']
data_subnet = ['255.255.255.192','255.255.255.224']

host = "10.10.20.200"
username = "admin"
password = "Admin12345"

headers = {
'Accept': 'application/yang-data+json',
'Content-Type': 'application/yang-data+json'
}

auth = (username, password)

for i in range(2,4):
    url = "https://{}/restconf/data/ietf-interfaces:interfaces/interface=GigabitEthernet{}".format(host,
str(i))

    payload = json.dumps({
"ietf-interfaces:interface": {
    "name": "GigabitEthernet{}".format(str(i)),
    "description": "Configured by RESTCONF subnet {}".format(str(i-1)),
    "type": "iana-if-type:ethernetCsmacd",
    "enabled": True,
    "ietf-ip:ipv4": {
    "address": [
        {
        "ip": data_ip[i-2],
        "netmask": data_subnet[i-2]
        }
    ]
    }
    }
    })
```

```
}}
```

```
response = requests.put(url, auth=auth, headers=headers, data=payload, verify=False)
print(response)
```

```
url = "https://{}/restconf/operations/cisco-ia:save-config/".format(host)
resp = requests.post(url, auth=auth, headers=headers, verify=False)
print("save " + resp.text)
```

D. Membuat Script NXAPI (./NXAPI/config.py)

Script ini digunakan untuk mengkonfigurasi 2 switch nxos9000 (S1) dan (S2) menggunakan nxapi. Pada script ini berisi konfigurasi interface dan konfigurasi vlan. Disini vlan yang digunakan vlan 101 untuk interface yang terhubung dengan PC. Lalu juga save running-config ke startup-config.

```
import requests
import json
requests.packages.urllib3.disable_warnings()
```

```
host = ['10.10.20.201', '10.10.20.202']
ip_interfaces = ['172.16.0.2/26', '172.16.0.66/27']
ip_vlan = ['172.16.101.2/26', '172.16.101.66/27']
```

```
headers = {
    'Content-Type': 'application/json',
}
auth = ('admin','Admin12345')
```

```
for i in range(1, len(ip_interfaces) + 1):
    url = "https://{}/ins".format(host[i-1])
    commands = [
        "vlan 101 ;name prod",
        "interface vlan 101 ;description config by NXAPI prod ;no shutdown ;no ip redirects ;ip address { } ;".format(ip_vlan[i-1]),
        "interface ethernet 1/1 ;description config by NXAPI connect to R{ } ;ip address { } ;no shut".format(i, ip_interfaces[i-1]),
        "interface ethernet 1/2 ;description config by NXAPI connect to host ;switchport ;switchport access vlan 101 ;spanning-tree port type edge ;no shutdown ;"
    ]
```

```
for x in range(4):
    payload = json.dumps({
        "ins_api": {
            "version": "1.0",
            "type": "cli_conf",
            "chunk": "0",
            "sid": "1",
            "input": commands[x],
            "output_format": "json"
```

```

    }
  })
  response = requests.request("POST", url, auth=auth, headers=headers, data=payload, verify=False)
  print(response.json()['ins_api']['outputs']['output'])

# config interface S2 e1/3
url = "https://{}/ins".format(host[1])
commands = [
  "interface ethernet 1/3 ;description config by NXAPI connect to host ;switchport ;switchport access",
  "vlan 101 ;spanning-tree port type edge ;no shutdown ;",
  "copy run start"
]
for i in range(2):
  payload = json.dumps({
    "ins_api": {
      "version": "1.0",
      "type": "cli_conf",
      "chunk": "0",
      "sid": "1",
      "input": commands[i],
      "output_format": "json"
    }
  })

  response = requests.post(url, auth=auth, headers=headers, data=payload, verify=False)
  print(response.json()['ins_api']['outputs']['output'])

```

E. Ansible for Backup Running Configuration Router and Switch

1. Membuat Ansible Config (ansible.cfg)

script untuk konfigurasi ansible yang akan digunakan

```

[defaults]
inventory=./my_hosts
host_key_checking=False
retry_files_enabled=False
deprecation_warnings=False

```

2. Membuat host file (my_hosts)

file ini untuk inisialisasi ip host, username, password, hostname, ansible network, ansible python interpreter, port

```

R1 ansible_user=admin ansible_password=Admin12345 ansible_host=10.10.20.200 ansible_port=22
ansible_network_os=cisco.ios.ios ansible_python_interpreter=/usr/bin/python3

S1 ansible_user=admin ansible_password=Admin12345 ansible_host=10.10.20.201 ansible_port=22
ansible_network_os=cisco.ios.ios ansible_python_interpreter=/usr/bin/python3

```

```
S2 ansible_user=admin ansible_password=Admin12345 ansible_host=10.10.20.202 ansible_port=22
ansible_network_os=cisco.ios.ios ansible_python_interpreter=/usr/bin/python3
```

3. Membuat playbook (playbook.yml)

playbook untuk backup running-configuration pada router dan switch pada lab

```
---
- name: AUTOMATIC BACKUP OF RUNNING CONFIG Project Lab R1
  hosts: R1
  gather_facts: false
  connection: ansible.netcommon.network_cli

  tasks:
  - name: DISPLAYING THE RUNNING-CONFIG
    ios_command:
      commands:
      - show running-config
    register: config

  - name: SAVE OUTPUT TO ./backups/
    copy:
      content: "{{ config.stdout[0] }}"
      dest: "backups/backup_{{ inventory_hostname }}_project.txt"

- name: AUTOMATIC BACKUP OF RUNNING CONFIG Project Lab S1
  hosts: S1
  gather_facts: false
  connection: ansible.netcommon.network_cli

  tasks:
  - name: DISPLAYING THE RUNNING-CONFIG
    ios_command:
      commands:
      - show running-config
    register: config

  - name: SAVE OUTPUT TO ./backups/
    copy:
      content: "{{ config.stdout[0] }}"
      dest: "backups/backup_{{ inventory_hostname }}_project.txt"

- name: AUTOMATIC BACKUP OF RUNNING CONFIG Project Lab S2
  hosts: S2
  gather_facts: false
  connection: ansible.netcommon.network_cli

  tasks:
```

```

- name: DISPLAYING THE RUNNING-CONFIG
  ios_command:
    commands:
      - show running-config
  register: config

- name: SAVE OUTPUT TO ./backups/
  copy:
    content: "{{ config.stdout[0] }}"
    dest: "backups/backup_{{ inventory_hostname }}_project.txt"

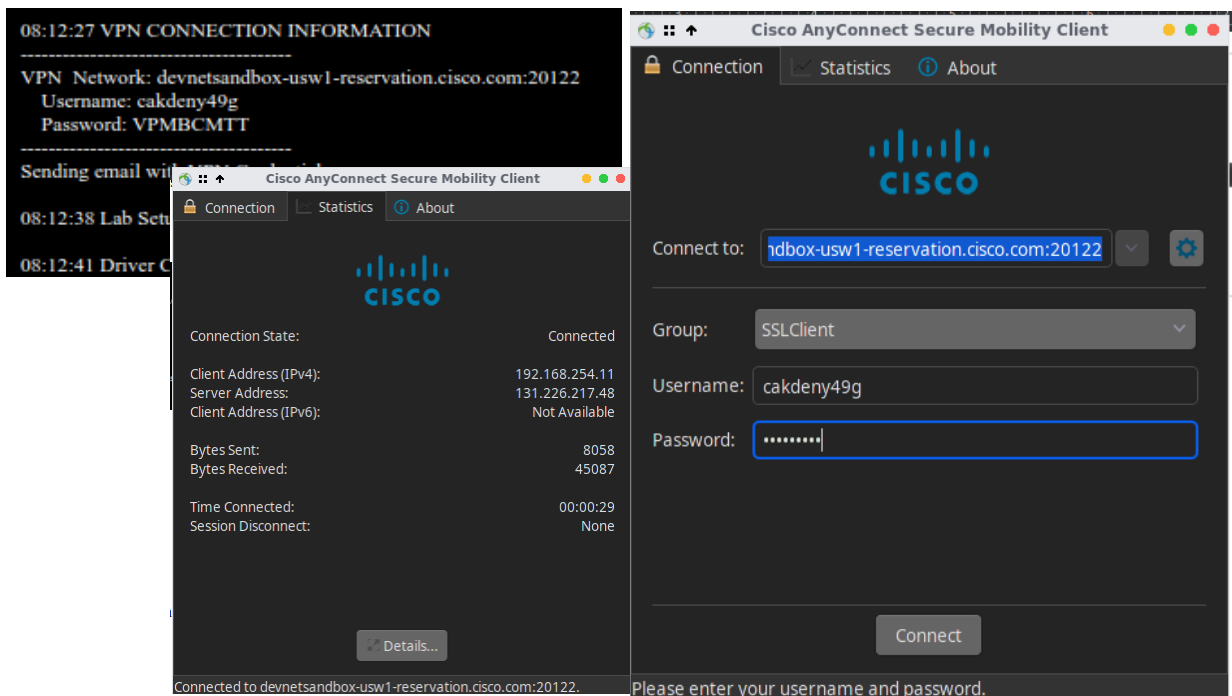

```

F. Menyiapkan Breakout Tools

1. Mendownload *breakout-linux-x86_amd64*, karena saya menggunakan os linux, bagi yang windows silahkan download yang windows version
2. menambahkan execute file permission pada user dengan ***chmod u+x breakout-linux-x86_amd64***
3. menjalankan ***./breakout-linux-x86_amd64 config*** untuk membuat file config.yaml
4. menjalankan ***./breakout-linux-x86_amd64 ui*** untuk menjalankan breakout tool gui pada localhost:port sesuai pada config.yaml

G. Menjalankan Simulasi Build Automation dan Backup Automation

1. Membuat virtual environment agar package tidak mengganggu root package pada laptop dengan ***python3 -m venv finalProject***
2. masuk ke directory dengan ***cd finalProject***
3. aktivasi virtual environment dengan ***source bin/activate***
4. install ***requests*** untuk kegunaan RESTFUL API dan ***ansible*** untuk kegunaan backup running configuration dengan ansible dengan ***pip3 install requests && pip3 install ansible***
5. Connect ke VPN yang telah disiapkan oleh Cisco melauai Cisco AnyConnect Secure Mobility dengan memasukkan url dan password

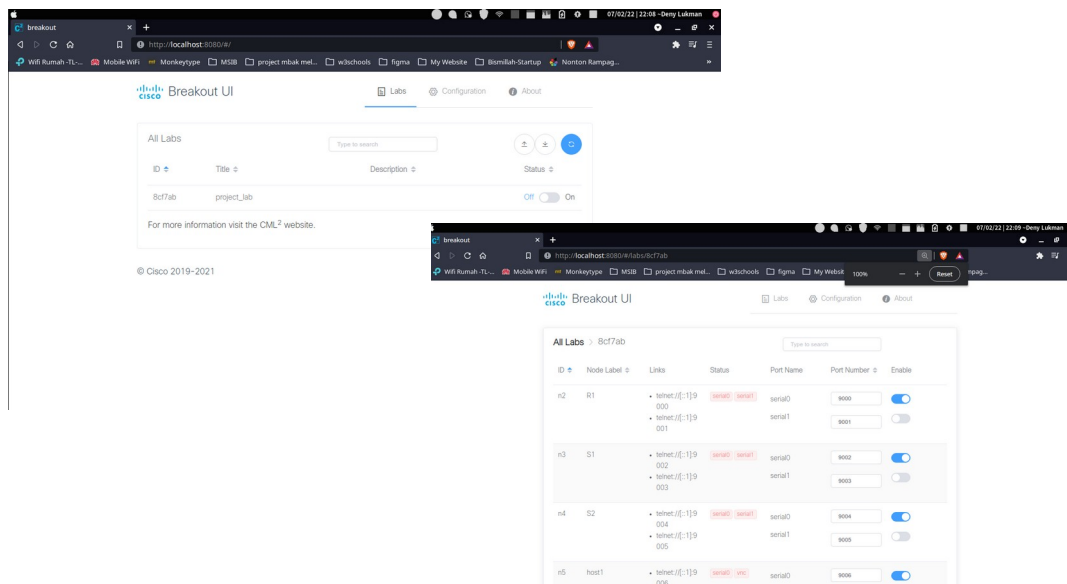

9. Menjalankan lab dengan menginputkan **1** dan pada lab no inputkan **2** untuk menjalankan lab tersebut

```
8. update config node
9. create interfaces
10. create links
=====
choose (1-9) / 0 for exit: 1
start lab no : 2
Starting Lab with id 8cf7ab ...
status: Success
```

10. Menjalankan `./breakout-linux-x86_amd64 ui`

```
cakdeny49@cakdeny-hplaptop14ck0xxx ~/Documents/msib-network-programmability/Fin
md64 ui
Starting up...
W0702 22:03:02.640621 *19684 run.go:238] open labs.yaml: no such file or direc
Running... Serving UI/API on http://[::]:8080, Ctrl-C to stop.
```

11. Buka web dengan url yang tertera pada terminal dan ubah ke mode **on**, supaya bisa diakses lewat local

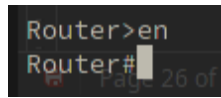

12. Setting awal router dan switch melalui telnet localhost port untuk konfigurasi ip management agar bisa diakses lewat ssh melalui vpn, karena ketika disetting melalui interaktif program methodnya tftp sehingga tidak bisa diakses. Untuk konfigurasi management router dan switchnya sudah ada pada directory `./script-config/` pada **config-R1.txt**, **config-S1.txt**, dan **config-S2.txt**.

13. Buka console R1, S1, dan S2 melalui terminal, copy dari script config dan paste ke console melalui R1: localhost 9000, S1: localhost 9002, S2: localhost 9004. Untuk username dan password pada Switch menggunakan cisco untuk pertama kali.

```
cakdeny49@cakdeny-hplaptop14ck0xxx ~/Documents/msib-network-programmability/Final_project/finalProject/src/CML $ telnet localhost 9000

host2:~$

```

21. Backup running-configuration dengan ansible dengan menjalankan **ansible-playbook playbook.yml** pada **./ansible**

The screenshot displays a terminal window with the following components:

- Left Sidebar (File Explorer):** Shows a directory tree under 'UNTITLED (WORKSPACE...)'. The 'backups' folder is selected and highlighted in green. It contains three files: 'backup_R1_project.txt', 'backup_S1_project.txt', and 'backup_S2_project.txt'.
- Terminal Output:** Shows the execution of an Ansible playbook. The output includes:
 - Task: [DISPLAYING THE RUNNING-CONFIG] for Project Lab R1. Status: ok: [R1].
 - Task: [SAVE OUTPUT TO ./backups/] for Project Lab R1. Status: changed: [R1].
 - Task: [DISPLAYING THE RUNNING-CONFIG] for Project Lab S1. Status: ok: [S1].
 - Task: [SAVE OUTPUT TO ./backups/] for Project Lab S1. Status: changed: [S1].
 - Task: [DISPLAYING THE RUNNING-CONFIG] for Project Lab S2. Status: ok: [S2].
 - Task: [SAVE OUTPUT TO ./backups/] for Project Lab S2. Status: changed: [S2].
 - Task: PLAY RECAP. Status: ok=2, changed=1, unreachable=0, failed=0, skipped=0, rescued=0, ignored=0.
- Terminal Prompt:** The prompt is '(finalProject) cakdeny49@cakdeny-hplaptop14ck0xxx ~/Documents/msib-network-programmability/Final_project/finalProject/src/CML/ansible \$'.

22. get topology lab dengan interaktif program

```
1. { 'state': 'STOPPED',
    'created': '2021-07-27 12:49:04',
    'lab_title': 'Small NXOS/IOSXE Network',
    'lab_description': 'A sample network built with IOS XE, NX-OS, IOS XR, and
    'owner': 'ASA devices. Includes Linux hosts.',
    'owner': 'developer',
    'node_count': 18,
    'link_count': 16,
    'id': 'b4bb2d' }

2. { 'state': 'STARTED',
    'created': '2022-07-02 10:55:20',
    'lab_title': 'project_lab',
    'lab_description': '',
    'owner': 'developer',
    'node_count': 8,
    'link_count': 9,
    'id': '8cf7ab' }
```

Menu:

```
0. exit
1. start lab
2. stop lab
3. create lab
4. delete lab
5. get topology lab
6. create node
7. delete node
8. update config node
9. create interfaces
10. create links
```

choose (1-9) / 0 for exit: 5
get topology lab no : 2
Processing get topology 8cf7ab...
do u want to save the topology to the file? (y/n): y
Success save topology in ./topology/lab_8cf7ab.json and ./topology/lab_8cf7ab.yaml
